solubility practice problems answer key

Understanding solubility is fundamental in chemistry, especially when dealing with solutions, mixtures, and reactions. Solubility practice problems serve as an essential tool for students and professionals to master the concepts related to how substances dissolve in solvents. To enhance your learning process, an answer key for these practice problems provides clarity and confidence in solving similar questions independently. This article offers a comprehensive guide to solubility practice problems, complete with detailed solutions, tips, and strategies to improve your problem-solving skills.

What Is Solubility?

Definition of Solubility

Solubility refers to the maximum amount of a substance (solute) that can dissolve in a solvent at a specific temperature and pressure to form a saturated solution. It is typically expressed in units such as grams per liter (g/L), moles per liter (mol/L), or as a percentage.

Factors Affecting Solubility

Several factors influence how well a substance dissolves, including:

- Temperature
- Pressure (especially for gases)
- Nature of solute and solvent (polarity, molecular structure)
- Presence of other substances (common ions, competing solutes)

Types of Solubility Practice Problems

Solubility problems can vary widely in complexity, but they generally fall into these categories:

- Calculating Solubility from Data

Given experimental data, determine the solubility of a substance.

- Determining the Saturation of a Solution

Assess whether a solution is saturated, unsaturated, or supersaturated based on the amount of solute dissolved.

- Calculating the Mass or Moles of Solute Dissolved

Find out how much solute is dissolved in a given volume of solution.

- Using Solubility Product Constant (K_{sp})

Apply K_{sp} to determine the solubility of slightly soluble salts.

Solubility Practice Problems with Answer Key

Below are sample problems accompanied by detailed solutions to illustrate how to approach and solve typical solubility questions.

Problem 1: Calculating Solubility from Data

Question:

A solution contains 36 grams of NaCl dissolved in 1 liter of water at 25°C. Is this solution saturated, unsaturated, or supersaturated? The solubility of NaCl at 25°C is approximately 36 g/L.

Solution:

Since the solution contains 36 g of NaCl per liter, which matches the known solubility limit at 25°C, the solution is saturated.

Answer:

The solution is saturated at 25°C.

Problem 2: Determining if a Solution is Saturated

Question:

You have 50 grams of KNO_3 dissolved in 1 liter of water at 20°C . The solubility of KNO_3 at 20°C is 32 g/L. Is the solution saturated, unsaturated, or supersaturated?

Solution:

- Actual dissolved amount: 50 g
- Solubility limit: 32 g/L

Since $50\text{ g} > 32\text{ g}$, the solution contains more than the maximum dissolved at equilibrium, indicating it is supersaturated.

Answer:

The solution is supersaturated.

Problem 3: Calculating the Mass of Solute in a Saturated Solution

Question:

What is the maximum mass of AgCl that can be dissolved in 2 liters of water at 25°C ? The solubility of AgCl at 25°C is 0.89 g/L.

Solution:

- Solubility of AgCl : 0.89 g/L
- Volume of water: 2 L

Total maximum mass = solubility $\times$ volume = $0.89\text{ g/L} \times 2\text{ L} = 1.78\text{ g}$

Answer:

A maximum of 1.78 grams of AgCl can dissolve in 2 liters of water at 25°C .

Problem 4: Using K_{sp} to Find Solubility

Question:

Calculate the molar solubility of calcium fluoride (CaF_2), given that its K_{sp} at 25°C is 3.9×10^{-11} .

Solution:

The dissociation of CaF_2 :

Let the molar solubility be s mol/L.

$$- [\text{Ca}^{2+}] = s$$

$$- [\text{F}^-] = 2s$$

$$K_{sp} = [\text{Ca}^{2+}][\text{F}^-]^2 = s \times (2s)^2 = s \times 4s^2 = 4s^3$$

Set equal to K_{sp} :

$$4s^3 = 3.9 \times 10^{-11}$$

Solve for s :

$$s^3 = (3.9 \times 10^{-11}) / 4 = 9.75 \times 10^{-12}$$

$$s = (9.75 \times 10^{-12})^{(1/3)} \approx 2.15 \times 10^{-4} \text{ mol/L}$$

Answer:

The molar solubility of CaF_2 at 25°C is approximately 2.15×10^{-4} mol/L.

Strategies for Solving Solubility Problems

To efficiently navigate solubility problems, consider the following tips:

Understand the Problem Type

Identify whether the question asks for solubility, saturation level, or involves K_{sp} calculations.

Convert Units Carefully

Pay attention to units?convert grams to moles if necessary, and ensure volume units are consistent.

Use Known Solubility Data

Remember standard solubility values at specific temperatures, which can serve as benchmarks.

Apply Correct Equations

- For mass-based problems: $\text{mass} = \text{solubility} \times \text{volume}$
- For molar calculations: use molar mass and molar ratios
- For K_{sp} problems: set up equilibrium expressions based on dissociation equations

Check Your Work

Verify if your calculated solubility makes sense within known data ranges, and confirm units.

Additional Practice Problems

Here are some additional questions for further practice:

- Calculate the molarity of a saturated solution of BaSO_4 at 25°C , given that its solubility is $0.011 \text{ g}/100 \text{ mL}$.
- Determine if adding 10 grams of Na_2SO_4 to 1 liter of water at 20°C results in a saturated solution.
- Find the solubility of $\text{Mg}(\text{OH})_2$ at 25°C given its K_{sp} is 1.8×10^{-11} .

Common Types of Solubility Practice Problems and Their Answer Keys

Solubility problems vary in complexity, ranging from straightforward calculations to multi-step equilibrium analyses. The most common types include:

- Determining solubility from given data
- Calculating solubility product constants (K_{sp})
- Predicting precipitate formation
- Calculating concentrations in saturated solutions
- Analyzing the effects of temperature or common ions

Let's explore each with insights into their answer keys.

1. Calculating Solubility from Ksp Values

Problem Example:

Given the Ksp of AgCl is 1.77×10^{-10} , calculate the solubility of AgCl in mol/L.

Solution Steps:

- Write the dissociation equation:

- Assume solubility = s mol/L; then:

$$[\text{Ag}^+] = s$$

$$[\text{Cl}^-] = s$$

- Write the Ksp expression:

$$K_{sp} = [\text{Ag}^+][\text{Cl}^-] = s \cdot s = s^2$$

- Solve for s :

$$s = \sqrt{K_{sp}} = \sqrt{(1.77 \times 10^{-10})} = 1.33 \times 10^{-5} \text{ mol/L}$$

Answer:

The solubility of AgCl is approximately 1.33×10^{-5} mol/L.

Answer Key Notes:

- Clarifies assumptions (pure, saturated solution)
- Demonstrates the algebraic manipulation

- Emphasizes the importance of units and significant figures

2. Predicting Precipitate Formation

Problem Example:

Will a precipitate form when 0.0100 mol of BaCl_2 is added to 1.00 L of a solution containing 0.0010 mol of sulfate ions (SO_4^{2-})? K_{sp} of BaSO_4 is 1.1×10^{-10} .

Solution Steps:

- Calculate the initial concentrations:

$$[\text{Ba}^{2+}] = 0.0100 \text{ mol} / 1 \text{ L} = 0.0100 \text{ M}$$

$$[\text{SO}_4^{2-}] = 0.0010 \text{ mol} / 1 \text{ L} = 0.0010 \text{ M}$$

- Determine the ionic product:

$$[\text{Ba}^{2+}][\text{SO}_4^{2-}] = (0.0100)(0.0010) = 1.0 \times 10^{-5}$$

- Compare with K_{sp} :

Since $1.0 \times 10^{-5} \gg 1.1 \times 10^{-10}$, the ionic product exceeds K_{sp}

- Conclusion:

Precipitate will form because the ionic product exceeds the solubility product.

Answer:

Yes, BaSO_4 will precipitate under these conditions.

Answer Key Notes:

- Explains the concept of ionic product versus K_{sp}

- Demonstrates threshold determination for precipitation
- Reinforces the importance of initial concentrations

Challenges and Common Pitfalls in Solubility Practice Problems and Their Answer Keys

Despite the straightforward nature of many solubility calculations, several challenges can compromise understanding if not properly addressed in answer keys:

1. Misapplication of Solubility Rules

Students may incorrectly apply or memorize rules without understanding exceptions, leading to errors in predicting solubility or precipitate formation.

Answer key tip:

Include clarifications on exceptions and nuanced cases, such as complex ions or temperature effects.

2. Significance of Units and Significant Figures

Incorrect units or careless rounding can cause inaccuracies.

Answer key tip:

Explicitly state units at each step and specify rounding conventions.

3. Overlooking Temperature Dependence

Many students neglect that solubility and K_{sp} are temperature-dependent, leading to errors in calculations involving temperature changes.

Answer key tip:

Highlight the temperature conditions and, where relevant, include temperature-based data or equations.

4. Confusion Between Solubility and Molar Solubility

Confusing molar solubility with solubility expressed in grams per 100 mL can produce mistakes.

Answer key tip:

Differentiate clearly and provide conversion steps when necessary.

Best Practices for Creating and Utilizing Solubility Practice Problems Answer Keys

To maximize educational value, educators and authors should adhere to best practices:

- Detailed Step-by-Step Solutions:

Break down each problem thoroughly, explaining the rationale behind every step.
