Key Features to Observe in Bread Mould

Hyphae:

Filamentous structures forming the mycelium; they can be septate (with cross walls) or aseptate.

Sporangia:

Round or oval structures that contain spores; they are crucial for asexual reproduction.

Sporangiophores:

Stalks supporting the sporangia; they rise above the mycelium to disperse spores.

Spores:

Reproductive units that develop within the sporangia; they are released to germinate into new hyphae.

Rhizoids and Stolons:

Root-like structures (rhizoids) anchor the mould, while stolons are horizontal hyphae connecting different parts of the colony.

Understanding the Life Cycle of Bread Mould

The life cycle of *Rhizopus stolonifer* involves both sexual and asexual reproduction. In the practical, you primarily observe asexual reproduction via sporangia and spores:

- Vegetative Growth:

Hyphae grow and form a network called mycelium.

- Asexual Reproduction:

- Formation of sporangia on sporangiophores.
- Sporangia produce spores through mitosis.
- Spores are released and germinate under favorable conditions, forming new hyphae.

- Sexual Reproduction (if conditions favor):

- Fusion of + and ? mating types forming zygospores, which are thick-walled spores capable of surviving harsh conditions.

Understanding these stages helps interpret the observations and comprehend fungal adaptability and reproduction.

Safety and Sterilization Tips

- Always sterilize work surfaces and instruments before and after the experiment.
- Handle mould samples carefully to prevent inhalation of spores.
- Dispose of used materials by autoclaving or disinfecting with alcohol.
