- **Chord:** A segment with both endpoints on the circle.
- **Arc:** A part of the circle's circumference.
- **Sector:** A region bounded by two radii and an arc.
- **Segment:** A region bounded by a chord and an arc.

## Important Theorems and Properties Related to Circles

### Central and Inscribed Angles

- **Central Angle Theorem:** An inscribed angle is half the measure of the intercepted arc.
- **Inscribed Angle Theorem:** Angles inscribed in a circle that subtend the same arc are equal.

### Angles Formed by Chords, Secants, and Tangents

## Common Types of Problems and Their Solutions

### Finding Arc Length and Sector Area

Problem: Given a circle with radius 10 units and a central angle of  $60^\circ$ , find the arc length and the sector area.

Answer:

- Arc length:  $L = \left(\frac{\theta}{360}\right) \times 2\pi r = \left(\frac{60}{360}\right) \times 2\pi \times 10 = \left(\frac{1}{6}\right) \times 20\pi \approx 10.47$  units.
- Sector area:  $\left(\frac{\theta}{360}\right) \times \pi r^2 = \left(\frac{60}{360}\right) \times \pi \times 100 = \left(\frac{1}{6}\right) \times 100\pi \approx 52.36$  square units.

### Calculating Chord Length

Problem: Find the length of a chord that subtends a  $45^\circ$  central angle in a circle with radius 12 units.

Answer:

- Using the chord length formula:  $c = 2r \sin(\theta/2) = 2 \times 12 \times \sin(22.5^\circ) \approx 24 \times 0.383 = 9.19$  units.

### Determining the Measure of an Inscribed Angle

Problem: An inscribed angle intercepts an arc measuring  $100^\circ$ . Find the measure of the inscribed

angle.

Answer: The inscribed angle is half the intercepted arc:  $100^\circ/2 = 50^\circ$ .

## Solving for the Radius or Diameter

Problem: A chord of length 16 units intercepts a  $60^\circ$  central angle. Find the radius of the circle.

Answer:

- Use the chord length formula:  $c = 2r \sin(\theta/2)$ .
- $16 = 2r \sin(30^\circ)$  ?  $16 = 2r \times 0.5$  ?  $16 = r$  ? radius is 16 units.

## Common Types of Problems in the Review Sheet

The review sheet typically encompasses a variety of problem types, each requiring specific strategies. Understanding these allows for efficient problem-solving.

### 1. Finding Unknown Lengths

Sample problem:

Given a circle with radius 10 units, find the length of a chord that subtends a  $60^\circ$  central angle.

Solution approach:

- Use the relationship between the chord length  $(c)$ , radius  $(r)$ , and the central angle  $(\theta)$ :

$$c = 2r \sin\left(\frac{\theta}{2}\right)$$

- Plugging in values:

$$c = 2 \times 10 \times \sin(30^\circ) = 20 \times 0.5 = 10 \text{ units}$$

Answer: The chord length is 10 units.

## 2. Arc Length and Sector Area Calculations

Arc Length Formula:

$$L = \frac{\theta}{360^\circ} \times 2\pi r$$

Sector Area Formula:

$$A_{\text{sector}} = \frac{\theta}{360^\circ} \times \pi r^2$$

Example problem:

Find the length of an arc subtended by a  $90^\circ$  angle in a circle with radius 8 units.

Solution:

$$L = \frac{90^\circ}{360^\circ} \times 2\pi \times 8 = \frac{1}{4} \times 2\pi \times 8 = \frac{1}{4} \times 16\pi = 4\pi \approx 12.57 \text{ units}$$

Answer: The arc length is approximately 12.57 units.

## 3. Inscribed and Central Angles

Key Concept:

- Central angles are equal to the measure of their intercepted arcs.
- Inscribed angles are half the measure of their intercepted arcs.

Problem example:

An inscribed angle intercepts a  $100^\circ$  arc. Find the measure of the inscribed angle.

Solution:

$$\text{Inscribed angle} = \frac{1}{2} \times 100^\circ = 50^\circ$$

Answer: The inscribed angle measures  $50^\circ$ .

## Advanced Problem Topics and Solutions

The review sheet often presents more challenging problems that require synthesis of multiple concepts, such as tangent-chord angles, cyclic quadrilaterals, and coordinate geometry applications.

### 1. Tangent and Chord Angles

Key insight:

- The angle formed between a tangent and a chord is equal to the measure of the intercepted arc.

Example problem:

In a circle, a tangent touches the circle at point T, and a chord AB passes through T. If the measure of arc AB is  $80^\circ$ , find the measure of angle TAB (angle between tangent and chord).

Solution:

- The angle between the tangent and the chord equals half the measure of the intercepted arc:

$$\angle TAB = \frac{1}{2} \times 80^\circ = 40^\circ$$

Answer: The angle is  $40^\circ$ .

### 2. Cyclic Quadrilaterals

Property:

- Opposite angles in a cyclic quadrilateral sum to  $180^\circ$ .

Problem example:

In a circle, quadrilateral ABCD is cyclic. If angle ABC measures  $110^\circ$ , what is the measure of angle ADC?

Solution:

- Opposite angles sum to  $180^\circ$ :

$$\angle ABC + \angle ADC = 180^\circ$$

- Therefore,

$$\angle ADC = 180^\circ - 110^\circ = 70^\circ$$

Answer: The measure of angle ADC is  $70^\circ$ .

## Coordinate Geometry Approach to Circles

Some review questions involve algebraic methods, particularly when given the circle's equation. Understanding how to interpret and manipulate these equations is key.

### Equation of a Circle

- General form:

$$(x - h)^2 + (y - k)^2 = r^2$$

where  $(h, k)$  is the center, and  $r$  is the radius.

Example problem:

Find the coordinates of the center and radius of the circle given by  $x^2 + y^2 - 6x + 8y + 9 = 0$ .

Solution:

- Complete the square for  $x$  and  $y$ :

$$x^2 - 6x + y^2 + 8y = -9$$

$$(x^2 - 6x + 9) + (y^2 + 8y + 16) = -9 + 9 + 16$$

$$(x - 3)^2 + (y + 4)^2 = 16$$

Result:

- Center:  $(3, -4)$
- Radius:  $r = \sqrt{16} = 4$

## Common Mistakes and Tips for Success

To ensure mastery of circle concepts, it's important to recognize common errors and adopt effective strategies.

### Common Mistakes

- Confusing inscribed and central angles: Remember, central angles are equal to the intercepted arc, while inscribed angles are half.
- Misapplying the tangent theorem: The tangent line is always perpendicular to the radius at the point of contact.
- Incorrectly calculating arc lengths: Ensure the angle is in degrees and correctly relates to the fraction of the circle.
- Neglecting to complete the square: Essential for converting general circle equations into standard form.

### Tips for Effective Study and Problem Solving

**Question** What is the definition of a tangent to a circle? A tangent to a circle is a straight line that touches the circle at exactly one point, called the point of tangency, and is perpendicular to the radius drawn to that point. How do you find the length of a tangent segment from an external point to a circle? If two tangent segments are drawn from a common external point to a circle, they are equal in length. To find the length, use the distance formula from the external point to the circle's point of tangency or apply the Pythagorean theorem if the radius and distance from the external point to the circle's center are known. What is the relationship between the measure of an inscribed angle and its intercepted arc? The measure of an inscribed angle is half the measure of its intercepted arc. In other words, if an angle is inscribed in a circle, its degree measure equals half the degree measure of the arc it subtends. How do you determine if two chords in a circle are congruent? Two chords are congruent if they are equidistant from the center of the circle, or if they subtend arcs of equal measure. Alternatively, if the chords are given with equal lengths, they are congruent. What is the property of the angles formed by two secants intersecting outside a circle? The measure of the angle formed outside the circle by two secants is equal to half the difference of the measures of the intercepted arcs. How do you find the length of a secant segment in a circle? If a secant segment intersects a circle at points A and B, and the external segment from the external point to the closer intersection is of length outside, and the entire secant length is known, you can use the secant-secant power theorem:  $(\text{external segment}) (\text{full secant length}) = (\text{tangent segment})^2$ , or apply similar triangles to find unknown lengths.
