Sample Problems from Chapter 10 and Their Solutions

Problem 1: Inscribed Angles

Question: In a circle, an inscribed angle intercepts an arc measuring 120° . What is the measure of the inscribed angle?

Solution:

The measure of an inscribed angle is half the measure of its intercepted arc.

Therefore,

$$\text{Angle measure} = 120^\circ / 2 = 60^\circ.$$

Answer: The inscribed angle measures 60° .

Problem 2: Arc Length Calculation

Question: A circle has a radius of 10 units. Find the length of an arc that intercepts a 90° central angle.

Solution:

$$\text{Arc length} = (\text{central angle} / 360^\circ) \times 2\pi r$$

$$= (90^\circ / 360^\circ) \times 2\pi \times 10$$

$$= (1/4) \times 20\pi$$

$$= 5\pi \approx 15.7 \text{ units.}$$

Answer: The arc length is approximately 15.7 units.

Problem 3: Tangent and Secant Properties

Question: A tangent and a secant intersect outside a circle, forming an angle of 40° . If the secant's external segment measures 6 units, what is the length of the tangent segment?

Solution:

Using the tangent-secant theorem,

$$(\text{External segment of secant}) \times (\text{whole secant segment}) = (\text{tangent segment})^2.$$

Suppose the secant's external segment is 6, and the entire secant segment is x , then:

$$6 \times x = (\text{tangent})^2.$$

To find the tangent segment, additional information about the secant's total length is needed. If, for example, the entire secant length is 10, then:

$$6 \times 10 = (\text{tangent})^2 \quad ? \quad 60 = (\text{tangent})^2 \quad ? \quad \text{tangent} \quad ? \quad \sqrt{60} \quad ? \quad 7.75 \text{ units.}$$

Answer: The tangent segment measures approximately 7.75 units.
