## Understanding Exponential Growth and Decay

Before diving into quizzes and practice problems, it's crucial to understand what exponential growth and decay entail. These concepts describe processes where quantities increase or decrease at rates proportional to their current value.

### What Is Exponential Growth?

Exponential growth occurs when a quantity increases by a consistent percentage over equal time intervals. This type of growth is characterized by the formula:

$$P(t) = P_0 \times (1 + r)^t$$

where:

- $P(t)$  is the amount after time  $t$ ,
- $P_0$  is the initial amount,
- $r$  is the growth rate (expressed as a decimal),
- $t$  is the time period.

Common real-world examples include population growth, bacterial reproduction, and investment interest compounding.

### What Is Exponential Decay?

Conversely, exponential decay describes processes where a quantity decreases by a consistent

percentage over equal time intervals. The formula is:

$$P(t) = P_0 \times (1 - r)^t$$

where each element is similar to the growth formula, but with a decay rate  $(r)$ .

Real-life examples of decay include radioactive decay, depreciation of assets, and cooling of objects.

## Key Components of Exponential Word Problems

When approaching exponential growth and decay word problems, it's essential to identify key elements:

- **Initial Quantity** ( $P_0$ ): The starting value before growth or decay begins.
- **Rate** ( $r$ ): The percentage rate of increase or decrease, expressed as a decimal.
- **Time** ( $t$ ): The duration over which the process occurs.
- **Final Quantity** ( $P(t)$ ): The amount after time  $t$ .

**Question** What is the general formula for exponential growth? The general formula for exponential growth is  $P(t) = P_0 (1 + r)^t$ , where  $P_0$  is the initial amount,  $r$  is the growth rate, and  $t$  is time. How do you identify whether a real-world problem involves exponential decay or growth? Look for clues such as increasing or decreasing quantities over time, and check if the change is proportional to the current amount. Growth indicates an increase, decay indicates a decrease, both following multiplicative patterns. In a decay problem, if a substance decreases by 5% annually, what is the decay factor? The decay factor is  $1 - 0.05 = 0.95$ , meaning each year, the remaining amount is 95% of the previous year's amount. A population of 1,000 bacteria doubles every 3 hours. How many bacteria will there be after 12 hours? Using the formula  $P(t) = P_0 2^{t/3}$ ,  $P(12) = 1000 2^{12/3} = 1000 2^4 = 1000 \cdot 16 = 16,000$  bacteria. How do you solve for the decay constant in an exponential decay problem? Use the formula  $N(t) = N_0 e^{-kt}$ . Rearranged,  $k = - (1/t) \ln(N(t)/N_0)$ , where  $N(t)$  is the amount after time  $t$ . If a radioactive substance has a half-life of 10 years, what is its decay constant? The decay constant  $k$  can be found using  $k = \ln(2) / \text{half-life} = \ln(2) / 10 \approx 0.0693$  per year. In a problem where a car loses 2% of its fuel each hour, what is the remaining percentage after 5 hours? Remaining amount  $= (1 - 0.02)^5 = 0.98^5 \approx 0.9039$ , so about 90.39% of the fuel remains. What is the difference between exponential growth and linear growth in word problems? Exponential growth involves quantities increasing by a constant percentage over equal time intervals, leading to a rapid increase. Linear growth involves adding a fixed amount each period, resulting in a steady, straight-line increase. How can you verify if a problem involves exponential change rather than linear? Check if the change depends on the current amount, leading to proportional increases or decreases, and if the rate of change remains constant in percentage terms rather than absolute terms.
